Instructions for the start of class on Wednesday, April 22nd

Each person has been assigned to one of the three papers below for which they will serve as an “expert” for the next class period. Please read all assigned material but focus most closely on your paper.

Papers

I will provide a large piece of paper for each group at the start of class to be used to quickly outline the paper assigned. Feel free to get started when you arrive. I will come early with the supplies. Please BE PREPARED to put this together quickly with your teammates as we will only use approximately 10 minutes at the start of class to assemble these summaries based on the questions below.

Questions

Concerning the HapMap Project, 1000 Genomes, and Rosenberg, et al.:

1. What year was this study published?
2. How many individual samples were considered?
3. What is the source of these samples?
4. What diversity do these samples represent?
5. What type of data was collected?
6. What technology platform was used to collect the data?
7. List 3-5 main conclusions of the paper

As Mike mentioned in class, these paper, although not very long, are dense. Please do not feel stressed about questions that you might have about the specific details in each. We will work through any questions that you might have as a group during class.
